

**Amendment to the specification:**

Amend the paragraph bridging pages 12-13 as follows:

A reaction initiator, a sensitizer, a crosslinking agent, a hardening agent, a polymerization promoter ~~promoter~~, etc. may be added to the monomers if necessary. Examples of photoreaction initiators and photopolymerization initiators include benzophenone compounds, acetophenone compounds such as dichloroacetophenone and trichloroacetophenone, benzoin compounds, thioxanthone compounds, Michler's Ketone, benzyl compounds, benzoin alkyl ethers, benzyl dimethyl ketal, tetramethylthiuram monosulfide, azo compounds, etc. The initiators are described in detail in *Ultraviolet Ray Hardening System*, pages 63 to 147 (1989, General Technical Denter), etc. Preferable photoreaction initiators are benzophenone compounds and acetophenone compounds. Specific examples of the initiators include Irgacure 184, Irgacure 651, and Irgacure 1174 (trade names, Ciba-Geigy Japan Ltd.), etc.
